## Why is my wireless antenna not working

Chosen Solution If you have your phone connected to a wireless network in your house, that could be why you can still text, as that will go through the home network first, if connected. The first thing I would do is connect my phone to my computer, bring up iTunes, back up the phone, and then RESTORE it. I had to do this to mine last night. If that works, great. If not, let us know and we can go from there. Good luck! Those having issues with making/receiving phone calls go through these steps if you need help with understanding how to do a reset and if all else fails a DFU mode reset, I can assist. I am Apple Certified and have access to all service guides. 1.Verify that your carrier name appears in the status bar. at top left of the display. 2.Turn Airplane mode on, wait for the to appear in the status bar, and then turn it off again. 3.Reset Network Settings; Tap Settings > General > Reset > Reset Network Settings. 4.If your iPhone is in a case, try removing it to ensure that the case isn't interfering with the cell signal strength. If these dont work, Contact your carrier to find out the following: -If you are in an area with network coverage. -If there is a network outage. -The account is properly configured to your phone. Try to restore your phone and set it up as new. If the above does not work try this Apple Support Article on Troubling a No Service Iphone. Let me know if this works. It is probably because you have not bought it from a local carrier. Otherwise, you can try to keep the power button and the selection button downwards pushed at the same time up until the iPhone turns off and then on again. It will erase all the temporary files. Edward Rep: 37 1 Hi,all you need to do is toggle Settings>general>phone See that the Show caller Id to on. If your phone is jail broken,go Cydia search and install CALLER ID SBSETTINGS, toggle CALLER ID TO ON. REBOOT! It simply worked for me. Hajaja Rep: 37 1 Good day. I also have a problem. Accept and send messages without any problems. I call my friends but I can not call. How is this possible? None of these solution working for me.try \*#31# also not working.carrier selection manual working only for 30 seconds.call forwarding and caller id trick also not working.frustrated with apple now! Bonnie Rep: 13 1 my phone had water damage - sent to repair shop and they said it wasn't fixable but a month later everything is working except the ability to make a phone call or receive one. I am getting twitter notices so there is a connection. I'm able to use the camera and transfer the pictures from the phone to my computer, and the touch screen works fine. When I go to make a call and touch the phone number I get nothing. If I type in the number on the number pad it makes the noise with each number but when I click to connect the call, nothing. Help! I love my Iphone 5s and don't want to replace it. It have got an I phone 4s I just gone and bought at 10 top up and its not letting me make calls or revise calls I can't ring the top up it goes straight off as I tried to ring and it not doing anything Blow compressed air onto the phone and parts of phone that are for sound (input/output). Worked for me! In my case the issue was with the sim card and not the phone. So try with a different sim card. Guys, I barely need your help. I also can't make outgoing calls apparently I can receive calls. Can someone help me please? Iphone5 user here. I had the same problem, after updating my iPhone 4S to IOS 9.2.1 i could only receive calls when connected to 3G signal. After looking at all my settings, it turns out that the new update changed my "Do Not Disturb" settings to only receive calls from those in my contacts favorite list. the way to sort this out is to: Go to Settings - Do Not Disturb - Allow Calls From. Check to make sure its set to Everyone. having done this, my phone know receives calls from everyone, regardless of internet connection. Help this Helps This will only work for sprint users. 1. Turn you wifi on and connect 2. Then go to your phone dialing pad and dial ##873283# then hit the dial button 3. You will get a screen that pops up sorry I don't recall what it said then hit ok, you should get a second screen that pops up and hit ok, if you get a fail then you are not connected to a wifi 4. then try making a call if it doesn't go through then go to the settings>celluar>turn cellular data off and back on (I had to do this step and it worked for me) then try to make a call The explanation I got was I had to reconnect my calling connection with a tower, hope this helps Very glad to solve my problem. My own phone stopped receiving signals after 2 months that I bought it. It says Mobile networks not available, emergency calls only. An Engineer says its board problem,others says its software problem. Whats the way forward. Its Gionee S10 Lite Ade How to Access and Setting the Wireless Bridge CPE Through Computer Access: Step 1. Use a PoE adapter to power the wireless bridge through a network cable. Pay attention to the "PoE" and "LAN" ports marked on the PoE adapter, and power is supplied by POE instead of a DC power interface.Step 2. Use a network cable to connect the CPE "LAN" port, connect the network cable other ends to the PoE Adapter "POE" port, use another network cable to connect to the "LAN" port of the PoE adapter, and connect the other end of the network cable to the computer's "LAN" port. Step 3. Find the number of the Wireless Bridge CPE digital display tube. For example, the number is 1 and the CEP is the A master bridge, then the IP of this CPE is 192.168.255.101; if the CPE is the B slave bridge, then the IP address of the CPE is 192.168.255.201.¼ There is a table corresponding to a number and IP in the manual¼%.Step 4. Very important step: Modify your computer's IP address, change your computer's IP address to 192.168.255.xxx(192.168.255.xxx cannot be the same as the IP of the CPE), make your computer's IP and the bridge's IP address be on the same network segment so that you can access them. Please refer to the manual to modify the computer IP address step or Google searches how to modify the computer IP address, it is very simple.Step 5. After you modify your computer's IP address, you open the computer browser and enter the IP address of the wireless bridge to access. For example, enter 192.168.255.101 to access.Step 6. Enter the account password "admin/admin" to access, and set it after successful access. Purchase Tips: The installation of this device requires some network knowledge. If you can't install it, please let us know or contact a professional. If the product is damaged or missing accessories, please let us know to reissue a new set. This CPE cannot directly expand the WiFi range for you. If you have any questions, you can free feel let us know via Amazon or Email, we will quick response and help you solve questions. The wireless transmission speed between 2 bridges max is 300Mbps. The highest wire network speed that can be achieved max is 100Mbps. Can not provide up to 300Mbps wired network speed, because the LAN port of the wireless bridge is a 100M port. How to find and change CPE450 WiFi SSID and password? 1. Find the WiFi hotspot password of CPE450, path: Setting->Wireless-> Name(SSID) and Password. 2. Enter the new SSID and password and save. CPE450 Bridge WiFi Infomation: Default SSID: CPE5G\_5G165 Default Password: zllnkce123456165 Updated: 12/31/2020 by Computer Hope There many things that cause a Wi-Fi connection to stop working. Below is a list of the steps in order of most common to remedy this problem. Wi-Fi is not enabled on device Most modern laptops have a button that turns on and off the Wi-Fi on your computer as a security feature. Make sure your Wi-Fi is turned on by looking at any button or status light indicator. Usually, the light will be either blue or green when enabled. How do I enable and disable Wi-Fi? Verify the wireless connection is enabled In Windows, make sure the connection is not disabled by clicking Start, typing network connection in the Search text box, and clicking the View network connections option. Tip In Windows 8, type network connection anywhere on the Start screen and select the View network connections option in the search results.In Windows 10, type network status in the search text box next to Start, and press Enter. In the Status window, under the Change your network settings section, click the Change adapter options option. In the Network Connections window, if your wireless connection is listed, right-click it and select Enable. If you see "Disable," the network connection is already enabled. Verify the SSID and security key are correct If your wireless connections list shows multiple available wireless networks, make sure you are connecting to the right SSID (router name) and have entered the correct security key. If you are connecting to a neighbor's router or are entering the wrong security key, the laptop can't connect to the network. Make sure the Internet is working If you can connect to your Wi-Fi device, but your Internet is not working, the issue may be your Internet service and not your computer. Verify the Internet connection is working by making sure a different device, like another computer, smartphone, or tablet, can connect to the Internet. If the Internet works on another device, it is safe to assume that the issue is the computer. If the Internet is not working on any device, there may be a problem with the router, modem, or ISP (Internet service provider). Call the technical support team for your ISP for help with troubleshooting issues with your Internet connection issues. Reset modem and router It is not uncommon for a DSL modem, cable modem, or network router to encounter problems that prevent one or more devices from connecting to the network. To help verify this is not the issue, disconnect the power from the back of the modem and router. Once disconnected, wait 10-15 seconds and reconnect the power. Wait several minutes for the modem and router to reconnect to the Internet, then test the Internet connection on your computer. If you are still having problems, try rebooting the computer. Disable firewalls Having more than one software firewall installed on the computer can cause a lot of issues with your network connection. To help verify this is not a problem, we suggest temporarily disabling any firewalls on the computer. Disable the Windows Firewall or any Firewall that comes with security programs. How to enable or disable the Microsoft Windows Firewall. Restore Windows to an earlier copy If you are using Microsoft Windows and the Wi-Fi has worked in the past, try restoring Windows to an earlier copy. In some cases, bad software or settings may have caused problems with your Wi-Fi adapter or problems with Windows being able to access the Internet connection. How to restore Windows to an earlier copy. Reinstall wireless device and drivers Corrupt drivers or issues with the wireless drivers is another reason you may not be able to see any Wi-Fi networks or are having problems detecting your wireless card. Make sure you are not having driver issues by following the steps below. Remove the device and let Windows re-detect the Wi-Fi card Open the Windows Device Manager. In the Device Manager, expand the Network adapters section to see all network devices. Highlight your Wi-Fi or Wireless network adapter and press the Delete key to remove the device. If there is a check box to uninstall the drivers, leave it unchecked for the time being. Once the device is removed, close all windows, reboot the computer, and let Windows re-detect and install the network card. If letting Windows re-detect and install the wireless card does not resolve your issue, it may be the drivers themselves. Follow the steps below to reinstall the network card and wireless drivers. Reinstall the latest network drivers Locate and download the network drivers for your network adapter. If possible, we recommend getting the drivers directly from the manufacturer (e.g., Dell, HP, Linksys, or Netgear). Open the Windows Device Manager. In the Device Manager, expand the Network adapters section to see all network devices. Highlight your Wi-Fi or Wireless network adapter and press the Delete key to remove the device. If there is a check box to uninstall the drivers, check the box. Once the device is removed, close all open windows and install the downloaded drivers. If there is a setup or executable file for the drivers, run it. Reboot the computer and test the Internet connection to see if it works. Reposition wireless router or computer If your computer has difficulties maintaining a strong signal with your wireless router, it can cause connectivity issues. Make sure this is not a problem by trying to reposition the router and its antennas. If you are having signal strength issues, consider getting a range extender (repeater) for your home or office to make sure all areas get a strong signal. Alternatively, you can try changing the router's frequency to reduce signal interference from wireless devices. Hard reset the laptop If you have a laptop, try hard resetting it by following the steps below. How do I remove the battery from my laptop computer? After removing the battery and disconnecting the power cord, leave the computer off for 30 seconds. While off press and hold the power button in 5-10 second intervals. After 30 seconds, put the battery back in the computer and connect the power cord. Turn on the laptop and as the computer is booting, enter CMOS setup. How to enter the BIOS or CMOS setup. In CMOS setup, reset the CMOS settings to the default settings. Save the settings, and then exit the setup. How to reset CMOS or BIOS settings. If your Wi-Fi still does not work, try removing the Wi-Fi adapter from the Device Manager, and reboot your laptop to see if Windows detects the Wi-Fi adapter again. Upgrade router firmware If you have never had success with the computer connecting to the router, try upgrading the router's firmware. How do I update the firmware on my router? Operating system corruption If, after trying all of the above steps your Wi-Fi connection still doesn't work, the issue may be related to file corruption in the operating system. As a last resort, to help verify if you have bad hardware, we suggest erasing everything and reinstalling your operating system. Doing so may verify everything is clean on the computer and no problems exist. How to erase my hard drive and start over. Bad hardware If, after trying all previous suggestions you still have not been able to get the Wi-Fi connection to work, the Wi-Fi adapter or related hardware is defective. If you have a desktop with Wi-Fi built into the motherboard (onboard), check any antenna cable and if okay, have the motherboard replaced. If you have a laptop, we suggest having the laptop serviced. If the Wi-Fi doesn't work for multiple devices and you've done all of the above steps, it's a router problem and needs to be replaced. Workaround If replacing hardware is not in your budget or you need a quicker solution, a workaround would be to connect a USB network adapter to the computer. These adapters are relatively cheap and can be installed quickly into the computer assuming nothing else is wrong with the computer.
